Sorting Comparisons

BUBBLE SORT V/S SELECTION SORT

- Bubble Sort- It is the sorting technique in which we compare two adjacent elements and swap them until we get our intended sequence.
- Just like the movement of air bubbles in the water that rise up to the surface, each element of the array move to the end in each iteration Therefore, it is called a bubble sort.

CONTINUED....

- Selection Sort- It is the sorting technique in which we select the first element of our list as the minimum element and then try to find out the smallest element in our list and then perform swapping.
- By this the smallest element is placed at the first position in our list and then we solve the same technique for all the unsorted elements at the right of the swapped element.
- We continue this technique until we get our intended sequence.

SELECTION SORT (JAVA CODE)

```
// Selection sort in Java

import java.util.Arrays;

class SelectionSort {
    void selectionSort(int array[]) {
        int size = array.length;

        for (int step = 0; step < size - 1; step++) {
            int min_idx = step;

            for (int i = step + 1; i < size; i++) {

                // To sort in descending order, change > to < in this line.
                // Select the minimum element in each loop.
                if (array[i] < array[min_idx]) {
                    min_idx = i;
                }
            }

            // put min at the correct position
            int temp = array[step];
            array[step] = array[min_idx];
            array[min_idx] = temp;
        }
    }

    // driver code
    public static void main(String args[]) {
        int[] data = { 20, 12, 10, 15, 2 };
        SelectionSort ss = new SelectionSort();
        ss.selectionSort(data);
        System.out.println("Sorted Array in Ascending Order: ");
        System.out.println(Arrays.toString(data));
    }
}
```

BUBBLE SORT (JAVA CODE)

```
// Bubble sort in Java

import java.util.Arrays;

class Main {

    // perform the bubble sort
    static void bubbleSort(int array[]) {
        int size = array.length;

        // loop to access each array element
        for (int i = 0; i < size - 1; i++)

            // loop to compare array elements
            for (int j = 0; j < size - i - 1; j++)

                // compare two adjacent elements
                // change > to < to sort in descending order
                if (array[j] > array[j + 1]) {

                    // swapping occurs if elements
                    // are not in the intended order
                    int temp = array[j];
                    array[j] = array[j + 1];
                    array[j + 1] = temp;
                }
    }

    public static void main(String args[]) {

        int[] data = { -2, 45, 0, 11, -9 };

        // call method using class name
        Main.bubbleSort(data);

        System.out.println("Sorted Array in Ascending Order:");
        System.out.println(Arrays.toString(data));
    }
}
```

BUBBLE SORT (COMPARISONS)

- Bubble Sort compares the adjacent elements.

Cycle	Number of Comparisons
1st	$(n-1)$
2nd	$(n-2)$
3rd	$(n-3)$
.....

- Hence, the number of comparisons is
- $(n-1)+(n-2)+(n-3)+\dots+1=n(n-1)/2$
- Which is nearly equal to n^2

SELECTION SORT (COMPARISONS)

Cycle	Number of Comparison
1st	(n-1)
2nd	(n-2)
3rd	(n-3)
...	...
last	1

Number of comparisons: $(n - 1) + (n - 2) + (n - 3) + \dots + 1 = n(n - 1) / 2$ nearly equals to n^2

NUMBER OF COMPARISONS

- Selection sort: As we can see from the code that to find the minimum element at every iteration, we will have to traverse the entire unsorted array.
- Bubble sort: In this also we can see from the code that we will stop the procedure after a single pass.

NUMBER OF SWAPS

- Selection Sort- We see in the code that in Selection sort i -th smallest element is selected and is placed at i -th position.
- Bubble Sort- Whereas Bubble sort repeatedly compares and swaps (if needed) adjacent elements in every pass.

IN-PLACE AND OUT-PLACE IMPLEMENTATIONS

- Both Selection Sort and Bubble Sort are In Place sorting algorithms as they require $O(1)$ extra space for exchanging elements.
- So, they can't be compared on the basis of In Place and Out Place sorting algorithms as both are In Place.
- Only Merge Sort requires $O(N)$ extra space and comes under the category of Out Place sorting algorithms.
